**Please add the following new Abstract of the Disclosure:**

A fluid dispenser having a fluid reservoir (1; 1') with an opening (10; 10') formed by a neck (10) having a top end (12) and an inside wall defining a narrow aperture segment (111) in the vicinity of the top end, and a recessed segment (112) extending below the narrow aperture segment. A dispensing member (2) is provided with a body (20) and a fixing member (3; 3') having a skirt (31; 31') that engages the opening, and with a sleeve (32) that engages around the body. The body forms a cam segment (204) for deforming the skirt outwards into pressed contact with the opening, the skirt (31) having a sealing zone (313) which, in the final position, comes into leaktight contact with the narrow aperture segment (111), and a fixing zone (314) which, in the final position, comes into tight-fitting contact with the recessed segment (112).
